

JavaScript and jQuery

John Resig - March 2008
ACM Northeastern University

JavaScript Language

- ◆ Basics
- ◆ Functions
- ◆ Function Prototypes
- ◆ Closures

The Basics

- ◆ Most akin to most other major languages
- ◆ Looping:
for (var i = 0; i < 10; i++) {} // array
for (var i in obj) // obj property/value
while (true) {}
- ◆ Statements:
if (true) {}

Variable Declaration

- ◆ Variable declaration:
`var foo = "bar";`
- ◆ Variables are scoped to the function, not to the block
- ◆

```
function test(){  
  for ( var i = 0; i < 10; i++ ) {}  
  return i;  
}  
test() == 10
```

Global Object

- ◆ JavaScript, by itself, isn't useful
 - ◆ Just a 'dumb' scripting language
 - ◆ Functionality must be introduced
- ◆ All functionality is contained within the global object (named 'window' in browsers)
- ◆ `var foo = "test";`
`window.foo == "test";`

Primitives

- ◆ Completely dynamic language - no “types”
- ◆ A few primitives:
 - ◆ Boolean: true / false
 - ◆ String: “hello”
 - ◆ Number: 4
- ◆ Type coercion
 - ◆ `0 == false`
 - ◆ `null == false`
 - ◆ `!“foo” == false`

- ◆ `var foo : string = "foo";`

- ◆ `var num : double = 5.0;`

- ◆

Objects

- ◆ Object

```
var obj = { key: "value", key2: "value2" };  
obj.key == "value";  
obj["key2"] == "value2";
```

- ◆ Array

```
var a = [ 0, 1, 2, 3 ];  
a.push( 4 );
```

- ◆ RegExp

```
/he{1}+o/i.test("hello")
```

- ◆ and Functions!

Functional

- ◆ JavaScript is a functional language
 - ◆ Functions are first-class objects
- ◆ `function test(){
test(test);`
- ◆ Anonymous Functions:
`var test = function(){`
- ◆ `setTimeout(function(){
 alert("1 second later");
}, 1000);`

Function Definition

- ◆ Defining a function makes it omnipresent, within its scope
- ◆

```
function test() {  
    return foo();  
    // Will never be reached, but that's ok  
    function foo(){ return 1; }  
}
```

Functions as Objects

- ◆ Functions can have properties

- ◆ `function test(){`

 - `test.a = 1;`

 - `test.b = 2;`

Self-Memoization

- ◆

```
function isPrime( num ) {  
    if ( isPrime.answers[ num ] != null )  
        return isPrime.answers[ num ];  
    var prime = num != 1;  
    for ( var i = 2; i < num; i++ )  
        if ( num % i == 0 ) {  
            prime = false;  
            break;  
        }  
    return isPrime.answers[ num ] = prime;  
}  
isPrime.answers = {};
```
- ◆ `isPrime(5) == true`

Function Context

- ◆ 'this' within a function

- ◆

```
var obj = {  
  fn: function(){  
    return this == obj;  
  }  
};  
obj.fn() == true
```

- ◆

```
function test(){  
  return this == window;  
}
```

Modify Context

- ◆ `[0,1,2].join(" ") == "0 1 2"`
- ◆ `{}.join.call([0,1,2], " ") == "0 1 2"`
- ◆ `{}.join.call("test", " ") == "t e s t"`
- ◆ `{}.join.apply("test", [" "]) == "t e s t"`
- ◆ `var str = "test";`
- ◆ `str.length`
`str[0] == "t"`

Instantiation

- ◆ No 'classes' in JavaScript
- ◆ You can instantiate a function

- ◆

```
function User( name ){  
    this.name = name;  
}
```

```
var user = new User( "John" );  
user.name == "John";
```

- ◆

```
User("John")  
name == "John"
```

Function Prototypes

- ◆ All functions have a prototype property
- ◆ All prototype properties are added to function instances
- ◆

```
function User(){  
  var u = new User();  
  User.prototype.setName = function(name){  
    this.name = name;  
  };  
  u.setName("John");  
  u.name == "John";
```

Inheritance

- ◆ Use the prototype to chain functions together

- ◆

```
function People(){  
  People.prototype.human = true;
```

```
function Resig(name){  
  this.firstName = name;  
}
```

```
Resig.prototype = new People();  
Resig.prototype.lastName = "Resig";  
var john = new Resig("John");
```

instanceof

- ◆ `var john = new Resig("John");`
`john instanceof Resig`
`john instanceof Person`
`john instanceof Object`
- ◆ All functions have a base prototype of `Object`

Native Prototypes

- ◆ You can extend the prototypes of native functions
- ◆ `String.prototype.join = function(array){
 return array.join(this);
};`
`“,”.join([0, 1, 2]) == “0,1,2”`
- ◆ Properties are added to all objects of the type
- ◆ Extending `Object.prototype` is really bad (can't loop over properties safely, anymore)

◆ Object.prototype.keys = function(){
 var a = [];
 for (var i in this)
 a.push(i);
 return a;
};
{a: 1, b: 2}.keys().length == 3

Closures

- ◆ Referencing an external variable encapsulates it for later access

- ◆

```
function Ninja(){
  var slices = 0;
  this.getSlices = function(){
    return slices;
  };
  this.slice = function(){
    slices++;
  };
}
var ninja = new Ninja();
ninja.slice();
ninja.getSlices() == 1
ninja.slices // doesn't exist
```

Currying

- ◆ Pre-fill in arguments to a function, generating a new function

- ◆

```
Function.prototype.curry = function() {  
    var fn = this, args = Array.prototype.slice.call(arguments);  
    return function() {  
        return fn.apply(this, args.concat(  
            Array.prototype.slice.call(arguments)));  
    };  
};
```

```
String.prototype.csv =  
    String.prototype.split.curry(/,\s*/);
```

```
var results = ("John, Resig, Boston").csv();  
results[1] == "Resig"
```

DOM

DOM Difficulty

- ◆ JavaScript programming can be hard
 - ◆ Problem isn't the JavaScript language
 - ◆ Cross-browser issues are frustrating
 - ◆ DOM can be clunky
- ◆ DOM is an object representation of an XML structure (in most cases, an HTML document)

DOM Methods

- ◆ `<div></div>`
`document.getElementsByTagName("div")`
- ◆ `<div id="test"></div>`
`document.getElementById("test")`
- ◆ `removeChild()`
- ◆ `appendChild()`
`insertBefore()`

JavaScript Libraries

- ◆ Come to the rescue!
- ◆ Drastically simplify DOM, Ajax, Animations
- ◆ Use a library, like jQuery!

jQuery

What is jQuery?

- ◆ An open source JavaScript library that simplifies the interaction between HTML and JavaScript.

Ideal for Prototyping

- ◆ Completely unobtrusive
- ◆ Uses CSS to layer functionality
- ◆ Easy to separate behavior
- ◆ Quick, terse, syntax

- ◆ `div { color: red; }`

- ◆ `div p { }`

- ◆

The Focus of jQuery

Find Some Elements Do something with them

`$("div").addClass("special");`

jQuery Object

The jQuery Object

- ◆ Commonly named '\$'
- ◆ Also named 'jQuery'
- ◆ Completely valid:
 - ◆ `jQuery("div").addClass("special");`

Find Some Elements...

- ◆ Full CSS Selector 1-3 Support
- ◆ Basic XPath
- ◆ Better CSS Selector support than most browsers

\$("div")

```
<div id="body">  
  <h2>Some Header</h2>  
  <div class="contents">  
    <p>...</p>  
    <p>...</p>  
  </div>  
</div>
```

\$("#body")

```
<div id="body">  
  <h2>Some Header</h2>  
  <div class="contents">  
    <p>...</p>  
    <p>...</p>  
  </div>  
</div>
```

\$("div#body")

```
<div id="body">
```

```
<h2>Some Header</h2>
```

```
<div class="contents">
```

```
<p>...</p>
```

```
<p>...</p>
```

```
</div>
```

```
</div>
```

\$("div.contents p")

```
<div id="body">  
  <h2>Some Header</h2>  
  <div class="contents">  
    <p>...</p>  
    <p>...</p>  
  </div>  
</div>
```

`$("div > div")`

```
<div id="body">
```

```
  <h2>Some Header</h2>
```

```
  <div class="contents">
```

```
    <p>...</p>
```

```
    <p>...</p>
```

```
  </div>
```

```
</div>
```

\$("div:has(div)")

```
<div id="body">
```

```
  <h2>Some Header</h2>
```

```
  <div class="contents">
```

```
    <p>...</p>
```

```
    <p>...</p>
```

```
  </div>
```

```
</div>
```

Do something with them

- ◆ **DOM Manipulation** (append, prepend, remove)
- ◆ **Events** (click, hover, toggle)
- ◆ **Effects** (hide, show, slideDown, fadeOut)
- ◆ **AJAX** (load, get, post)

DOM Manipulation

- ◆ `$(“a[target]”).append(“ (Opens in New Window)”);`
- ◆ `$(“#body”).css({
border: “1px solid green”,
height: “40px”
});`

Events

- ◆ `$(“form”).submit(function(){
 if ($(“input#name”).val() == “”)
 $(“span.help”).show();
});`
- ◆ `$(“a#open”).click(function(){
 $(“#menu”).show();
 return false;
});`

Animations

- ◆ `$("#menu").slideDown("slow");`

- ◆ **Individual properties:**

```
$("#div").animate({  
    fontWeight: "2em",  
    width: "+=20%",  
    color: "green" // via plugin  
});
```

- ◆ **Callbacks:**

```
$("#div").hide(500, function(){  
    // $(this) is an individual <div> element  
    $(this).show(500);  
});
```

Ajax

- ◆ `$("#body").load("sample.html div > h1");`
- ◆ Before:
`<div id="body"></div>`
- ◆ After:
`<div id="body">
<h1>Hello, world!</h1>
</div>`
- ◆ `$.getJSON("test.json", function(js){
 for (var name in js)
 $("#ul").append("" + name + "");
});`

Chaining

- ◆ You can have multiple actions against a single set of elements
- ◆ `$("#div").hide();`
- ◆ `$("#div").hide().css("color","blue");`
- ◆ `$("#div").hide().css("color","blue").slideDown();`

Chaining (cont.)

```
◆ $("ul.open") // [ ul, ul, ul ]  
  .children("li") // [ li, li, li ]  
    .addClass("open") // [ li, li, li ]  
  .end() // [ ul, ul, ul ]  
  .find("a") // [ a, a, a ]  
    .click(function(){  
      $(this).next().toggle();  
      return false;  
    }) // [ a, a, a ]  
  .end(); // [ ul, ul, ul ]
```

Why jQuery?

- ◆ Fully documented
- ◆ Great community
- ◆ Tons of plugins
- ◆ Small size (14kb)
- ◆ Everything works in IE 6+, Firefox, Safari 2+, and Opera 9+

Questions?

<http://ejohn.org/>
<http://jquery.com/>

◆ `{a, b, c} = { 0, 1, 2 }`

◆ `{ a for (var a = 0; a < 10; a++) }`

◆ `let foo = 5;`
